Improving the environment
by managing mobility

THE PROJECT

Today transport stands for one third of our energy consumption and more than 28% of CO₂ emissions. Various types of measures are therefore needed to influence this sector. **Mobility Management** is an innovative demand oriented approach that affects our travel habits and road user behaviour. **MOVE** is a project built on the partnership of 7 forward thinking European energy agencies or similar representing a variety of experiences in Mobility Management and with a common interest to increase their skills and engagement in transports. Partners in **MOVE** believe that a real change is possible if creative measures are combined with a strong commitment from local and regional key actors. Acting on both European and local level they wish to do their share in tackling the global climate change and achieving the Kyoto protocol targets. They believe that innovative transport solutions enhance the quality of life and foster regional development in many different ways. During the project period, 2006-08, the project partners in **MOVE** will acquire the skills, the tools and the platform needed for the work with transport. By carrying out projects on local level they will give input to some good examples and best practices for their future work.
